

INTERMEDIATE PROGRAMMING LESSON

Different Ways of Moving:
Synchronization, Regulated Power, Ramp up and
down

By: Droids Robotics

OBJECTIVES

- 1) Learn about different blocks for moving the robot and when to use which block
- 2) Learn about power regulation, motor synchronization, and ramp up/down

DIFFERENT WAYS TO MOVE

- How are these different from each other in terms of the following?

- Power Regulation
- Motor Synchronization
- Ramp up/ramp down

REGULATED POWER

- Regulated power tries to move the robot at a fixed target speed
- When the robot has trouble moving because it is heavy, it is moving uphill, its battery is dead, or it is blocked, power regulation gives more power to the motor to reach its target speed
- This is good for ensuring that the robot is moving at a predictable speed

SYNCHRONIZED MOTORS

- Synchronized motors makes sure that both motors turn the same amount (or at some fixed ratio)
- If one wheel gets stuck, it prevents the other wheel from spinning
- If you have the motors turning the same amount, it helps ensure that the robot moves straight when one wheel is slowed by friction or anything else
- When you have synchronized motors with a ratio, it makes the robot make predictable and smooth turns

Videos on next
slide

SYNCHRONIZED VS. UNSYNCHRONIZED

[Click to Watch Videos](#)

Synchronized motors

One motor getting stuck causes
other motor to stop

Unsynchronized motors

Second motor continues when first
gets stuck

RAMP UP / RAMP DOWN

- Ramp up makes the robot speed up gradually at the beginning of a move
- Ramp down makes the robot brake gradually at the end
- Without ramp up/ramp down you might see the robot jerk at the beginning or end
 - The robot will still adjust its motors after a brake to reach that target rotation sensor value but this may still be less accurate

DIFFERENT WAYS TO MOVE

		Regulated Power	Synchronized Motors	Ramp Up / Ramp Down
1		✓	✓	✓
2		✓	✓	✓
3		✓	X	X
4		X	X	X

MOVING DEGREES VS. SECONDS

Move Degrees/Rotations

- Block does not complete until the target degree rotation is reached
- So what if the robot gets stuck somewhere on the mat?
 - Program stalls and never goes to next block
 - You will have to save the robot and take a touch penalty

Move Seconds

- Less accurate for robot movement
 - Distance traveled depends on speed, battery level, weight of robot
- You have to remember this when deciding if move secs should be used.
- However, can help avoid stalls
 - E.g. Can be useful if your attachment arm gets stuck

Videos on next slide

MOVING DEGREES VS. SECONDS

Stalled Robot

Robot gets stuck. Finishes only when released.

Unstalled Robot

Robot gets stuck but still finishes (you can hear the sound)

DISCUSSION GUIDE

Fill in the chart below:

	Regulated Power	Synchronized Motors	Ramp Up / Ramp Down
